

## 5.25" FLOPPY DISK DRIVES

### 5.25" MINI FLOPPY DISK DRIVE

The following mini floppy disks are available:

- Single-Sided Double-Density (SSDD), formatted at 160 KB and used on 360 KB drives.
- Double-Sided Double-Density (DSDD), formatted at 360 KB and used on 360 KB and 1.2 MB drives. The 360 MB drive is usually present in XT-compatible systems.
- High-Density (HD), formatted at 1.2 MB and used on 1.2 MB drives. This type of drive is usually present in AT systems.

**3**

Bear the following rules in mind when using these disks.

- SSDD are generally not used any more. They should, for safety's sake, be copied onto DSDD disks.
- A 1.2 MB HD diskette should be used in 1.2 MB drives and formatted at 1.2 MB.
- A 1.2 MB drive can format a 360 KB diskette if the following format command is used: *Format/n:9/t:40*, or */f:360*.
- A 360 KB DSDD formatted and written on 360 KB can be read both by 360 KB and 1.2 MB drives.
- A 360 KB DSDD diskette formatted and written on 1.2 MB drives may be difficult to read on 360 KB drives, but not on 1.2 MB drives.
- If a 360 KB diskette from another system must be used, it is advisable to copy this diskette onto 1.2 MB diskette formatted on its own system.

### CONFIGURING DRIVE JUMPERS

Jumper settings on the floppy disk drives must not be changed from the default configuration shown in the figures of the drives.

The only exception is the TM jumper (terminator), which must be removed when the 5.25" drive is installed as the system's second drive. However, this terminator must be present if the 5.25" drive is the only one present in the system. The terminator is always present on 3.5" drives, and is soldered on the board.

The cross-over of some of the wires in the floppy disk's signals cable determines the drive's physical address. The drive attached to the first connector is recognized as drive A, while the drive attached to the second connector is recognized as drive B. Therefore there is no need to make any jumper settings on the drive to determine its address. As a general rule, all floppy disk drives must have the second jumper DS installed (in the ON position); in some drives, this jumper is identified as DS1 since the jumpers are numbered DS0, DS1, DS2 and DS3. In other drives, however, this jumper is identified as DS2 as the numbering of the jumpers differs, such DS1, DS2, DS3 and DS4.

**Note:** Jumpers EX, GX, DD and TH have been removed from drive JU-475-5 C08 starting from this drive's level 03 (March, '94). To set the disk change mode 2 on this drive (as used on L1 with G0280D, FP1 fw2.4, FP4 fw3.7), solder a 15 Kohm resistor at R18. The JU-475-5 C20 drive will no longer be available from March, 1994; instead, you can use drive JU-475-5 C08 by inserting jumper BX.
